                        ; ***************************************************************************
                        ;*DESCRIPTION
                        ;*-----------
                        ;*THIS TEST CHECKS THE ABILITY OF THE ECC CONTROLLER TO GIVE PRIORITY
                        ;*FOR DATA CORRECTION TO THE EDGE TRACKS (1 AND 9) WHEN GIVEN A MULTITUDE
                        ;*OF POINTERS WITH EQUAL VALUE.  THE PROGRAM FORCES BAD DATA ON TRACKS
                        ;*1 AND 9 (DATA BIT POSITIONS 2 AND 3) AND PRESENTS THE ECC WITH 9
                        ;*POINTERS OF EQUAL VALUE (SEE TABLE).  THE PROGRAM CHECKS FOR CORRECTED
                        ;*DATA AND THE TWO TRACK ERROR CORRECT STATUS BIT FROM THE ECC.
                        ;*
                        ;*      VALUE OF THE

 (1)                            ;*DESCRIPTION
 (1)                            ;*-----------
                                ;*THIS TEST WILL INJECT DATA THROUGH THE READ PATH FIFO'S AND CLOCK THE
                                ;*SYSTEM UNTIL AN 'SCLK' APPEARS TO SIGNAL 18 BITS OF DATA READY FOR
                                ;*TRANSMISSION ACROSS THE MASSBUS. EACH 'SCLK' TIME WILL HAVE THE 'DDR'
                                ;*REGISTERS SETUP WITH THE ASSEMBLED DATA AS COMMANDED BY THE PACKING
                                ;*MODE SELECTED IN THE TEST. ALL PACKING MODES ARE TESTED (I.E. 11-NORM
                                ;*TO 10-HI DEN COMPAT) IN A READ FORWARD DATA TRANSFER. THE TEST WILL
                                ;*CLOCK THE SYSTEM ONLY UNTIL THE EXPECTED AMOUNT OF 'SCLK' DATA HAS
                                ;*BEEN TESTED TO VERIFY THAT THE SELECTED PACKING MODE IS WORKING AS
                                ;*EXPECTED. THE READ PATH WILL BE FILLED WITH 8 SUBGROUPS WORTH OF DATA
                                ;*REGUARDLESS OF THE AMOUNT OF EXPECTED DATA GROUPS TO BE TESTED (USUALLY
                                ;*4 SUBGROUPS OF DATA WILL BE SUFFICIENT TO TEST A PACKING MODE). THE EXTRA
                                ;*SUBGROUPS OF DATA INJECTED WILL ELIMINATE THE NECESSITY OF CALCULATING
                                ;*THE 'SPECIAL' CHARACTERS FROM THE TAPE IN GCR MODE (I.E. CRC, ACRC, &
                                ;*RESID CHARACTERS). EVERY 4 BYTES OF DATA TO BE INJECTED WILL BE TURNED
                                ;*INTO A 5 BYTE SUBGROUP TO SIMULATE DATA FROM THE 'TAPE'. THE 'ECC'
                                ;*WILL BE CALCULATED FOR EACH 7 BYTE OF DATA INJECTED AND ALSO INJECTED
                                ;*AT THE PROPER TIME INTO THE FIFO'S.

                                ;*DESCRIPTION
                                ;*-----------
                                ;*THIS TEST WILL INJECT DATA THROUGH THE READ PATH FIFO'S AND CLOCK THE
                                ;*SYSTEM UNTIL AN 'SCLK' APPEARS TO SIGNAL 18 BITS OF DATA READY FOR
                                ;*TRANSMISSION ACROSS THE MASSBUS. EACH 'SCLK' TIME WILL HAVE THE 'DDR'
                                ;*REGISTERS SETUP WITH THE ASSEMBLED DATA AS COMMANDED BY THE PACKING
                                ;*MODE SELECTED IN THE TEST. ALL PACKING MODES ARE TESTED (I.E. 11-NORM
                                ;*TO 10-HI DEN COMPAT) IN A READ REVERSE DATA TRANSFER. THE TEST WILL
                                ;*CLOCK THE SYSTEM ONLY UNTIL THE EXPECTED AMOUNT OF 'SCLK' DATA HAS
                                ;*BEEN TESTED TO VERIFY THAT THE SELECTED PACKING MODE IS WORKING AS
                                ;*EXPECTED. THE READ PATH WILL BE FILLED WITH 8 SUBGROUPS WORTH OF DATA
                                ;*REGUARDLESS OF THE AMOUNT OF EXPECTED DATA GROUPS TO BE TESTED (USUALLY
                                ;*4 SUBGROUPS OF DATA WILL BE SUFFICIENT TO TEST A PACKING MODE). THE
                                ;*FIRST TWO GROUPS OF DATA ARE SIMULATED 'CRC' DATA GROUP AND THE 'RESID'
                                ;*DATA GROUP. THE RESIDUAL DATA GROUP WILL CONTAIN NO DATA CHARACTERS,
                                ;*JUST THE 6 PAD CHARACTERS AND A FAKE ACRC & FAKE ECC CHARACTER (ALL 0'S).
                                ;*THE CRC GROUP WILL CONTAIN A RESIDUAL CHARACTER THAT INDICATED NO DATA
                                ;*BYTES IN THE RESIDUAL DATA GROUP. EVERY 4 CHARACTER BYTES INJECTED WILL
                                ;*BE TURNED INTO A 5 BYTE SUBGROUP TO SIMULATE DATA FROM THE 'TAPE'. THE 'ECC'
                                ;*WILL BE CALCULATED FOR EACH 7 BYTE OF DATA INJECTED AND ALSO INJECTED
                                ;*AT THE PROPER TIME INTO THE FIFO'S. ALL DATA INJECTED INTO THE FIFO'S
                                ;*WILL BE REVERSED TO SIMULATE A READ REVERSE DATA TRANSFER.

 (1)                            ;*DESCRIPTION
 (1)                            ;*-----------
1339                            ;*THIS TEST WILL INJECT DATA THROUGH THE READ PATH FIFO'S AND CLOCK THE
1340                            ;*SYSTEM UNTIL AN 'SCLK' APPEARS TO SIGNAL 18 BITS OF DATA READY FOR
1341                            ;*TRANSMISSION ACROSS THE MASSBUS. EACH 'SCLK' TIME WILL HAVE THE 'DDR'
1342                            ;*REGISTERS SETUP WITH THE ASSEMBLED DATA AS COMMANDED BY THE PACKING
1343                            ;*MODE SELECTED IN THE TEST. ALL PACKING MODES ARE TESTED (I.E. 11-NORM
1344                            ;*TO 10-HI DEN COMPAT) IN A READ FORWARD DATA TRANSFER. THE TEST WILL
1345                            ;*CLOCK THE SYSTEM ONLY UNTIL THE EXPECTED AMOUNT OF 'SCLK' DATA HAS
1346                            ;*BEEN TESTED TO VERIFY THAT THE SELECTED PACKING MODE IS WORKING AS
1347                            ;*EXPECTED. THE READ PATH WILL BE FILLED WITH 8 SUBGROUPS WORTH OF DATA
1348                            ;*REGUARDLESS OF THE AMOUNT OF EXPECTED DATA GROUPS TO BE TESTED (USUALLY
1349                            ;*4 SUBGROUPS OF DATA WILL BE SUFFICIENT TO TEST A PACKING MODE). THE EXTRA
1350                            ;*SUBGROUPS OF DATA INJECTED WILL ELIMINATE THE NECESSITY OF CALCULATING
1351                            ;*THE 'SPECIAL' CHARACTERS FROM THE TAPE IN GCR MODE (I.E. CRC, ACRC, &
1352                            ;*RESID CHARACTERS). EVERY 4 BYTES OF DATA TO BE INJECTED WILL BE TURNED
1353                            ;*INTO A 5 BYTE SUBGROUP TO SIMULATE DATA FROM THE 'TAPE'. THE 'ECC'
1354                            ;*WILL BE CALCULATED FOR EACH 7 BYTE OF DATA INJECTED AND ALSO INJECTED
1355                            ;*AT THE PROPER TIME INTO THE FIFO'S.
1356  4300                      SP
